

### Skill 39: Resistance in a wire

158. Resistance is the difficulty an electron experiences traveling through a material.

The variable for resistance is R and the unit of measurement is  $\Omega$ .

159. An object's resistance depends on several factors.

Resistivity ( $\rho$ )

Length (L)

Listed on the Reference Table  
resistance.

Long wires have a large resistance

$$R = \frac{\rho L}{A}$$

Temperature

Cross-sectional Area (A)

High temp has a large resistance

Large X-section is small resistance  
 $\text{Area} = \pi r^2$

low resistance is Short, Fat, Cold, "Gold"  
metallic

160. What is the resistance of a piece of copper wire with a length of 1 meter and a cross sectional area of  $0.01 \text{ m}^2$ ?

$$R = ?$$

$$L = 1 \text{ m}$$

$$A = 0.01 \text{ m}^2$$

$$\rho = 1.72 \times 10^{-8} \Omega \cdot \text{m}$$

$$R = \frac{\rho L}{A} = \frac{(1.72 \times 10^{-8} \Omega \cdot \text{m})(1 \text{ m})}{0.01 \text{ m}^2} = 1.72 \times 10^{-6} \Omega$$

161. What is the composition of a wire with a resistance of 31.8 Ohms if it is  $5 \times 10^7$  meters long and has a cross-sectional area of  $0.025 \text{ m}^2$ ?

$$R = 31.8 \Omega$$

$$L = 5 \times 10^7 \text{ m}$$

$$A = 0.025 \text{ m}^2$$

$$\rho = ?$$

$$R = \frac{\rho L}{A}$$

$$\rho = \frac{RA}{L} = \frac{(31.8 \Omega)(0.025 \text{ m}^2)}{5 \times 10^7 \text{ m}} = .795$$

$$= \frac{.795 \Omega \cdot \text{m}^2}{5 \times 10^7 \text{ m}} = .159 \times 10^{-7} \Omega \cdot \text{m}$$
$$1.59 \times 10^{-8} \Omega \cdot \text{m}$$

162. A 14 gauge aluminum wire has a radius of  $8.0 \times 10^{-4}$  meter.

a. Calculate the cross sectional area of the wire.

$$A = \pi r^2$$

$$= \pi (8 \times 10^{-4} \text{ m})^2$$

$$= 3.14 (64 \times 10^{-8} \text{ m}^2) = 200.96 \times 10^{-8} \text{ m}^2 = 2 \times 10^{-6} \text{ m}^2$$

b. Calculate the resistance of the wire if it is 30.0 meters long.

$$R = \frac{\rho L}{A} = \frac{(2.82 \times 10^{-8} \Omega \cdot \text{m}) (30 \text{ m})}{2 \times 10^{-6} \text{ m}^2} = .423 \Omega$$

163. A 500 meter long wire with a cross-sectional area of  $4 \times 10^{-6} \text{ meter}^2$  has a resistance of 3.05 ohm. Calculate the resistivity of the wire then use the chart to determine the wire's composition.

$$L = 500 \text{ m}$$

$$A = 4 \times 10^{-6} \text{ m}^2$$

$$R = 3.05 \Omega$$

$$\rho = ?$$

$$R = \frac{\rho L}{A} \quad \rho = \frac{RA}{L}$$

$$\rho = \frac{(3.05 \Omega)(4 \times 10^{-6} \text{ m}^2)}{500 \text{ m}} = 2.4 \times 10^{-8} \Omega \cdot \text{m}$$

164. A 100 meter long wire has a resistance of 10 ohms. What would the resistance of each piece of this wire be if it were cut into four, equal length sections?

$$R = \frac{\rho L}{A}$$

R and L are directly related  
If L is divided by 4  
R is divided by 4

$$L \div 4 \text{ means } R \div 4 \quad \frac{10 \Omega}{4} = 2.5 \Omega$$

165. A 0.02 meter long carbon resistor with a cross sectional area of  $2 \times 10^{-6} \text{ meter}^2$  has a resistance of 300 ohms.

a. What would its resistance be if its length were doubled?  $L \times 2 \quad R \times 2$

R & L direct

$$300 \Omega \times 2 = 600 \Omega$$

b. What would its resistance be if its cross-sectional area were tripled?

R & A inverse

$$A \times 3 \quad R \div 3$$

$$\frac{300 \Omega}{3} = 100 \Omega$$

c. What would its resistance be if its radius were doubled? (Careful!)

R & r is inverse<sup>2</sup>

$$r \times 2 \quad R \div 4$$

$$\frac{300 \Omega}{4} = 75 \Omega$$

$$R = \frac{\rho L}{A}$$

$$R = \frac{\rho L}{\pi r^2}$$

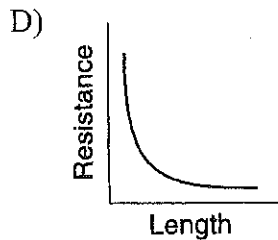

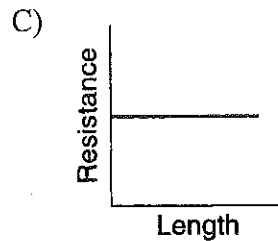

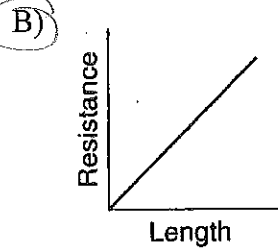

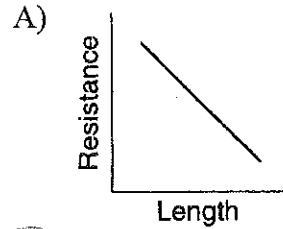

### Skill 39: Resistance in a wire

166. A manufacturer recommends that the longer the extension cord used with an electric drill, the thicker (heavier gauge) the extension cord should be. This recommendation is made because the resistance of a wire varies

- A) directly with length and inversely with cross-sectional area
- ~~B) inversely with length and directly with cross-sectional area~~
- ~~C) directly with both length and cross-sectional area~~
- ~~D) inversely with both length and cross-sectional area~~

$$R = \frac{\rho L}{A}$$

167. A copper wire is part of a complete circuit through which current flows. Which graph best represents the relationship between the wire's length and its resistance?

168. If the length of a copper wire is reduced by half, then the resistance of the wire will be

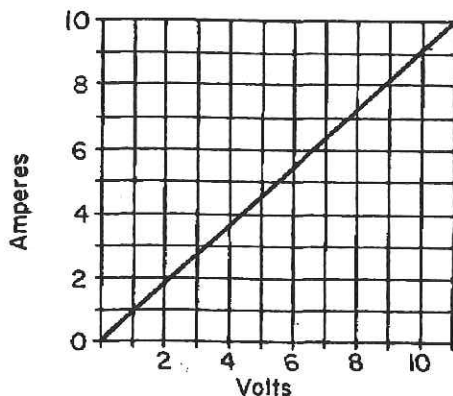

- A) halved
- B) doubled
- C) quartered
- D) quadrupled

$$R = \frac{\rho L}{A}$$

Direct  $L \div 2$   
means  $R \div 2$

### Skill 39: Resistance in a wire

169. Base your answer to the following question on the accompanying graph which shows the data collected for a copper wire at a constant temperature.

If the length of the copper wire being tested is decreased, its total resistance will

- (A) decrease      B) increase  
C) remain the same

Graph has nothing to do with question  
 $R = \frac{\rho L}{A}$

170. Which change decreases the resistance of a piece of copper wire?

- A) increasing the wire's length  $\uparrow$  direct  
B) increasing the wire's resistivity  $\uparrow$  direct  
(C) decreasing the wire's temperature  $\downarrow$  direct  
D) decreasing the wire's diameter  $\uparrow$  inverse

171. The resistance of a copper wire is measured to be 4 ohms at 20°C. If the wire is heated to 30°C, the resistance of the wire will be

- A) zero ohms      B) less than 4 ohms  
(C) more than 4 ohms      D) 4 ohms

172. To reduce the resistance of a metal conductor one should

- (A) cool the conductor to a low temperature  
B) heat the conductor to a high temperature  
C) coat the conductor with an insulator  
D) wire the conductor in series with another resistor

Short, fat, cold, gold

173. The electrical resistance of a metallic conductor is inversely proportional to its

- A) temperature *direct not in equation*  
B) length *direct*  
(C) cross-sectional area  $R = \frac{\rho L}{A}$   
D) resistivity *direct*

174. If the diameter of a wire were decreased, its electrical resistance would

- A) decrease      (B) increase  
C) remain the same

diameter is direct to radius  
radius is  $\propto r^2$  to  
 $R = \frac{\rho L}{A} = \frac{\rho L}{\pi r^2}$   
Resistance  $\propto \frac{1}{r^2}$   
so  $R \downarrow = R \uparrow$

175. If a wire of cross-sectional area equal to  $A$  has a resistance of  $R$ , then another wire of the same material with a cross-sectional area equal to  $2A$  will have a resistance of

- A)  $R$       B)  $2R$       (C)  $R/2$       D)  $R/4$

$$R = \frac{\rho L}{A}$$

inverse

$$A \times 2 = R \div 2$$

# Skill 39: Resistance in a wire

176. A copper wire has a resistance of 200 ohms. A second copper wire with twice the cross-sectional area and the same length would have a resistance of

A) 50Ω B) 100Ω  
C) 200Ω D) 400Ω

Copper	Copper
R = 200Ω	R = ?
A	2A

$$R = \frac{\rho L}{A}$$

$$A \times 2 = R = 2 \text{ so } \frac{200\Omega}{2}$$

177. At 20°C, four conducting wires made of different materials have the same length and the same diameter. Which wire has the least resistance?

A) aluminum  $2.82 \times 10^{-8} \Omega \cdot \text{m}$  B) gold  $2.44 \times 10^{-8} \Omega \cdot \text{m}$   
C) nichrome D) tungsten  $5.6 \times 10^{-8} \Omega \cdot \text{m}$

they have different  $\rho$   
lowest  $\rho$  = lowest  $R$

178. What is the resistance at 20°C of a 2.0-meter length of tungsten wire with a cross-sectional area of  $7.9 \times 10^{-7} \text{ meter}^2$ ?

A)  $5.7 \times 10^{-1} \Omega$  B)  $1.4 \times 10^{-1} \Omega$   
C)  $7.1 \times 10^{-2} \Omega$  D)  $4.0 \times 10^{-2} \Omega$

$$R = \frac{\rho L}{A} = \frac{(5.6 \times 10^{-8} \Omega \cdot \text{m})(2 \text{ m})}{(7.9 \times 10^{-7} \text{ m}^2)}$$

$$= 1.4 \times 10^{-1} \Omega$$

$$R_{\text{copper}} = R_{\text{aluminum}}$$

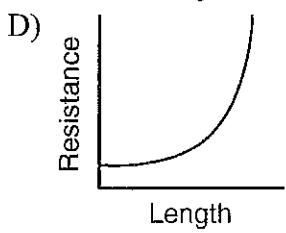

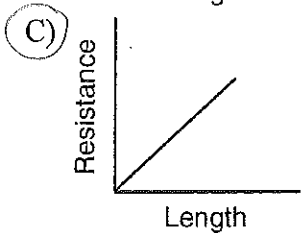

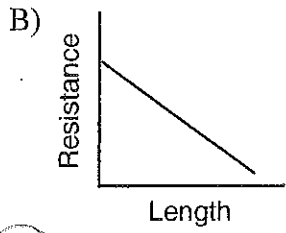

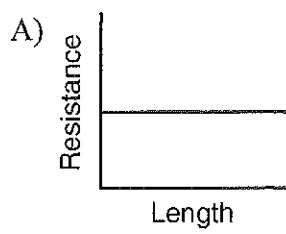

$$\frac{\rho L}{A} = \frac{\rho L}{A}$$

$$\rho L = \rho L$$

$$(1.72 \times 10^{-8} \Omega \cdot \text{m})(12 \text{ m}) = (2.82 \times 10^{-8} \Omega \cdot \text{m})(L)$$

$$L = 7.32 \text{ m}$$

179. Which graph best represents the relationship between resistance and length of a copper wire of uniform cross-sectional area at constant temperature?

$$R = \frac{\rho L}{A}$$

Direct

180. A 12.0-meter length of copper wire has a resistance of 1.50 ohms. How long must an aluminum wire with the same cross-sectional area be to have the same resistance?

A) 7.32 m B) 8.00 m  
C) 12.0 m D) 19.7 m

Copper	Aluminum
L = 12 m	L = ?
R = 1.5Ω	R = 1.5Ω
$\rho = 1.72 \times 10^{-8} \Omega \cdot \text{m}$	$\rho = 2.82 \times 10^{-8} \Omega \cdot \text{m}$

$$R = \frac{\rho L}{A} \rightarrow L = \frac{RA}{\rho} \text{ (Inverse)}$$

Solve for L
